

Redesign the Misleading Colored Chart

R.No: 7 Reg. No: 192324234 Name: BOGU MALLIKA

Each chart below uses color in a misleading or confusing way. For each one, answer the three questions in your own words.

Chart 1

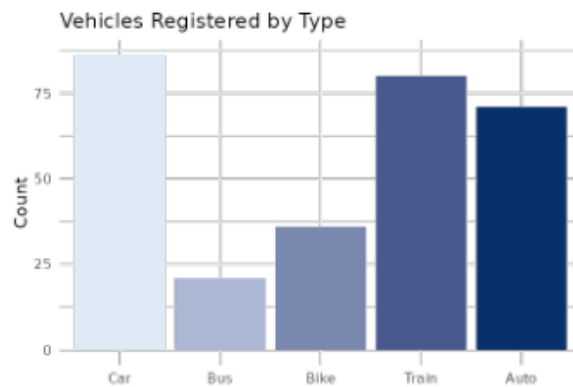

1. What is this chart trying to show?

2. What's wrong with the color choice?

3. Propose a better color scheme (describe it in words):

Chart 2

1. What is this chart trying to show?

2. What's wrong with the color choice?

3. Propose a better color scheme (describe it in words):

Redesign the Misleading Colored Chart – Full Answers

CHART 1

1. What is this chart trying to show?

This chart is trying to compare the profit and loss values of five different groups, namely Group 1 to Group 5. The red portion of each bar represents loss and the green portion represents profit. The chart helps the viewer understand and compare the financial performance of the groups.

2. What's wrong with the color choice?

The use of bright red and green can be visually misleading because these colors have strong conventional meanings. Red is commonly associated with danger, failure, or loss, while green is associated with success, safety, or profit. This may create an emotional impression in addition to showing the actual data. The strong colors also attract attention more than the numerical differences themselves.

3. Propose a better color scheme (describe it in words):

A better scheme would use two clearly distinguishable but more neutral colors, such as blue for profit and orange for loss. The same colors should be used consistently with a clear legend. This would make the comparison easy to understand while reducing unnecessary emotional or visual bias.

CHART 2

1. What is this chart trying to show?

This chart is trying to show and compare the number of vehicles registered for five different vehicle types: Car, Bus, Bike, Train, and Auto. The height of each bar represents the number of registrations, allowing the viewer to identify which vehicle types have higher or lower registration counts.

2. What's wrong with the color choice?

The chart uses several different shades of blue even though color does not represent a separate variable. Because the shades are very similar, they do not add meaningful information and may make the chart harder to interpret. A viewer might also incorrectly assume that the different shades represent different levels or categories of importance.

3. Propose a better color scheme (describe it in words):

A better choice would be to use one consistent color for all vehicle categories because the chart is comparing only the number of registrations. If separate colors are required, clearly contrasting colors should be used with a simple legend. A single neutral color would be the clearest option because the bar height should communicate the actual difference in registration counts.

Conclusion:

The charts should use clear, consistent, meaningful, and accessible colors so that the viewer focuses on the actual data rather than being influenced by unnecessary color differences. This improves readability, accuracy, and unbiased interpretation.
